raised toilet seat

A qualified medical professional should educate and train users for appropriate use. It is your responsibility to use this device correctly.

Raised toilet seats are helpful to those who have difficulty getting up and down from the regular home toilet. These devices provide a great deal of safety and independence for the user.

A qualified medical professional can determine the most appropriate one for you. It is wise to exercise care, discretion and common sense when sitting down or rising from the seat. If possible, sit down on the seat centered over the opening. Do not sit on the front edge and slide back over the opening. Do not slide forward onto the front edge of the seat to stand. These maneuvers can cause the seat to flip forward and could result in a fall. If it is not possible for you to avoid these maneuvers, it is essential that your raised toilet seat be equipped with rear locking brackets and that these brackets always be tightened securely. If it is necessary for you to do lateral or sliding transfers to and from the seat, you should select a model with locking brackets (front and rear).

You may consider the use of toilet safety rails in conjunction with the raised toilet seat. A medical professional can make a recommendation if needed. The two products complement each other and greatly enhance safety and independence over the use of either product alone.

A qualified medical professional should install toilet seat to insure appropriate installation.

It is your responsibility to maintain and provide upkeep of this item. It is your responsibility to use this device correctly.
