lift chair

A qualified medical professional should educate and train users for appropriate use. It is your responsibility to use this device correctly.

Lift chairs are powered recliners which can tilt forward to assist standing up. Two position lift chairs recline about halfway, three position can recline further and have a comfortable leg rest. Infinite position lift chairs can recline horizontally. Zero gravity chairs can lift the legs above heart level for users with special medical conditions. Some models are designed for extended use and sleeping. There are also heavy-duty models for users up to 600 pounds.

Lift chairs provide comfort and help increase your independence. Lift chairs are considered medical equipment, but you may not notice when looking at one. Most lift chairs are designed to look just like normal recliner chairs. When looking at the chair, most people probably won't even know that it is a lift chair, unless you were to tell them.

Lift chairs come in a variety of sizes and with moderately different functionality. If you just need that little boost to get yourself to a standing position or if you prefer to sleep right in your chair, then a lift chair can make a big difference for you.
